                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for the use of irinotecan (1) or treating colorectal, cervical, gastric, lung, ovarian or pancreation for ancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRR1) polynucleotide (II). (1) has cytostatic activity. (1) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic ancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.

                                             This invention relates to a novel isolated DNA molecule encoding a cholecystokinin (CCK) receptor protein. The invention also discloses a method for purifying a CCK receptor in 1% digitionin, applying the elucation containing CCK receptor in 1% digitionin, applying the solubilised receptor preparation to a cationic exchange resin and purifying the elucate of the resin. The purified elucate is then added to an agarose-bound lectin and applied the elucate to a cabacron blue sepharose column and a CCK receptor protein of sequenceable-grade purity. The CCK receptor protein of the invention may have immunomidulatory activity. The DNA molecule of the invention may have immunomidulatory activity. The DNA molecule of the invention is useful for purifying CCK receptor protein modulation of the immune system, and for a setuincendocrine modulation of the immune system, and for obtaining antibodies that can recognise CCK-expressing cells. The present sequence represents a RACE PCR PRIMET used to amplify the 3, end of the invention of the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTAL gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered has cytostatic activity. A composition of the invention acts as a topolsomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant gliona. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGT1A1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGT1A1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ss; irinotecan; cancer; UGT1A1; cytostatic; topoisomerase I inhibitor; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; uridine diphosphate glycosyltransferasel member A1.

The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant allales of the UGTAL gene, and if the patient has one or more of such variant allales, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's allales in the UGTALA gene. The invention has cytostatic activity. A composition of the invention acts as a topolsomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glions. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; multidrug resistance 1; MDR1; cytostatic; human; ds; Cyp3A5; MRP1; MDR1;

New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.

Claim 4; Page 69; 130pp; English.

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (WDR1) polymolectide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the

New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.

Disclosure; Page 41; 104pp; English.

The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, covarian or pancreatic cancer, or malignant gliome in a subject having a genome with a variant allele which comprises a multidrug resistance | (MDR1) polymucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.

The invention relates to an isolated or purified polymucleotide encoding a polypeptide (the wild-type form of which is involved in synaptogenesis) that includes at least one mutation associated with development of eneurological disease and/or a predisposition to development of mental content that modulate their activity. Also nucleic acid, polypeptide, polypeptide are used to screen for agents that modulate their activity. Also nucleic acid, polypeptide, or polypeptide are used to screen for containing the vector, are useful as pharmaceuticals for treating mental and neurological disorders, specifically autism, Asperger containing the nucleic acid and containing the nucleic acid and polypeptide can be used to similarly. Also detecting mutations in the nucleic acid and polypeptide, can be used to detect that affect formation of synapses and to disquose the nucleic formation of synapses and to disquose mental disease. This sequence corresponds to a PCR primer used to amplify the human wild type HNL4X (ADC24764) and HNL4Y (ADC24764) genes.
                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding mutant protein involved in synaptogenesis, useful for treatment and diagnosis of e.g. autism, Asperger syndrome, and schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 21 BP; 3 A; 5 C; 6 G; 7 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having agenome with a variant allele which comprises a multidaving resistance I (MDR1) polymuclectide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.

```
This invention relates to novel isolated peptides that selectively bind to mammalian atherosclerotic lesions and as such can be used to detect to mammalian atherosclerotic lesions and as such can be used to detect to the in vivo identification of such peptides by using phage display the in vivo identification of such peptides by using phage display conditions of beptides. Display the peptides of perhotogical conditions of the conditions of the endothelial tissue occurs by administration of a peptide conjugated to reporter molecule or therapeutic agent. As such, these peptides can be careforted variously as antiatherosclerotic, cerebroprotective, antianginal, thrombolytic, cardiant, optibalmological, neuroprotective, oppides as useful for treating atherosclerosis, as well as identifying the location and severity of an atherosclerosis, as well as identifying the location and severity of an atherosclerosis, myocardial infarction, ischaemic heart disease, transplantation-induced sclerosis and confinence, it is associated with diabetes, which in turn can lead to peripheral artery disease, congestive heart failure, retinopathy, neuropathy, nephropathy or thrombosis. This colliponucleotide sequence, isolated from a combinatorial phage display collibrary, encodes a peptide that binds to atherosclerotic lesions, the aim
                                                                                                                                                                                                                                                                                                Novel peptide which selectively bind to mammalian atherosclerotic lesions, useful for treating atherosclerosis in a mammal, and for identifying location of atherosclerotic lesion in mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 6 A; 4 C; 4 G; 7 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                               Claim 16; SEQ ID NO 93; 286pp; English

The present invention describes a novel enzymatic nucleic acid (ENA)

having a hammerhead motif (HM) comprising: (i) at least S ribose residues

(ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least

(c ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's

ccan inhibit collagenase and stromelysin production in the synovial

membrane of joints for the treatment or prevention of arthritis.

CC membrane of joints for the treatment or prevention of arthritis.

CC membrane of joints for the treatment or prevention of arthritis.

CC membrane of joints for the treatment or prevention of arthritis.

CC membrane of joints for the treatment or prevention of arthritis.

CC membrane of joints for the treatment of a donor to induce tolerance to a used to treat antigen presenting acels of a donor to induce tolerance of enhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysin which accompany treatment with retinoids and dexamethasone.

CC The concentration of ribozyme required to affect a therapoutic treatment con specific. The present sequence is used in the exemplification of the present invention

```
The present invention describes (A) an isolated HIV-1 Group O env polypeptide. Also described are: (1) an isolated HIV-1 Group O env polypeptide comprising an immunoreactive portion of a polypeptide as in (A) or (1); (2) a polymuclectide (PN) encoding a polypeptide as in (A) or (1); (3) an antigen construct comprising a first HIV-1 Group O env polypeptide (A) an antigen construct comprising a fusion of at least one HIV-1 Group O env polypeptide with at least one HIV-1 Group O env polypeptide with at least one HIV-1 Group O env polypeptide with at least one additional HIV-1 polypeptide; (5) an antigen construct comprising a fusion of a first HIV-2 env polypeptide; (6) an antigen construct of a first HIV-2 env polypeptide; (6) an antigen construct as in (3)-(6), (8) an expression vector comprising a mitigen construct as in (3)-(6), (8) an expression vector comprising a pN as in (7); (9) an immunoassay kit for the detection of antibodies to HIV-1 comprising an antigen construct as in (3)-(6). The antigen constructs can be used for the detection of anti-HIV-1 antibodies in test samples. They can also be used as immunogens to produce antibodies. The antibodies can be used to polypeptides, for therapy and for detection of HIV polypeptides, for therapy and for detection of HIV polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                 New isolated HIV-1 Group O env polypeptides - used for the detection of anti-HIV antibodies and for the production of antibodies for use in detection, purification and therapy.

The invention relates to a rapid assay for simultaneous detection and differentiation of antibodies to HIV-1 groups O and M, and HIV-2. The method comprises (a) contacting the sample with a strip containing at method comprises (a) contacting the sample with a strip containing at cleast one immobilised capture reagent par analyte and on which the sample conditions sufficient to form capture reagent par analyte complexes, and (b) determining the presence of analyte(s) by detecting a visible colour change at the capture reagent site on the strip wherein the capture comprises a polypeptide shown in AAV66983-84; and that for HIV-2 comprises the polypeptide shown in AAV66981. The invention is used to screen patients for antibodies to HIV-1 types O and M, and HIV-2. The invention will be particularly useful in the invention provides a screening method which is faster and requires comprises the polypeptide shown in the present patients for antibodies to HIV-1 types O and M, and HIV-2. The invention will be particularly useful in places and situation where equipment and/or electricity is not available. The invention provides a screening method which is faster and requires cless equipment than prior art methods. Sequences AAX37195-X37222 crepresent primers used for determining the env seqeunce of the HIV-1 course of group O isolate HAM112
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; secreted protein; immunestimulant; immunesuppressant; virucide; antibacterial; antifungal; cytostatic; antinflammatory; dermatological; antidiabetic; antiartheumatic; antirheumatic; protozoacide; antidiabetic; antiartheumatic; protozoacide; antithyroid; immune deficiency; autorection dimmunedeficiency; SCID; infection; HIV; hepatitis; malaria; autorimmune disorder; systemic lupus; connective tissue disease; multiple sclerosis; erythematosis; rheumatoid arthritis; autorimmune pulmonary inflammation; asthma; quillain-Barre syndrome; autorimmune thyroiditis; myasthenia strais autorimmune thyroiditis; myasthenia agravis; autorimmune inflammatory eye disease; allergy; hybridisation; probe; ss.

AAA16618 to AAA16697 encode the human secreted proteins given in AAY94898

to AAY94980, isolated from human adult brain, adult thyroid, adult
retina, foetal arcinoma, adult blood, adult heural, foetal kidney, adult
placenta, adult testis, whole embryo, adult cartilage, kidney, foetal
adult bladder, cDNA libraries. The polymicleotides and proteins are
predicted to have biological activities which would make them suitable
for treating, preventing or ameliorating medical conditions in humans and
animals. The polymicleotides can be used as markers for tissues in which
the protein is preferentially expressed, as molecular weight markers on
Southern gels, and as chromosome markers or tags to identify chromosomes
or to map gene positions. The proteins can be used in the treatment of
immunedeficiency (SCID), as well as viral, bacterial, fungal and other
infections. These infections include human immunodeficiency virus (HIV),
candidissis. The proteins can be used to treat autoimmune disorders such
as connective tissue disease, multiple sclerosis, systemic lupus
candidissis. The proteins can be used to treat autoimmune disorders activing activity inflammation,
dillain-Barre syndrome, autoimmune thyroiditis, insulin dependent
diabetes mellitus, myasthenia gravis, graft-versus-host-disease and
autoimmune inflammatory eye disease. The proteins can also be used to
treat allergic conditions, such asthma. AAA16688 to AAA16774 represent
probes for the human secreted proteins from the present invention

Novel monoclonal antibodies useful as positive control reagent for detecting human immunodeficiency virus infections and diagnosing, evaluating or prognosing viral disease.

Example 2; Page 37; 148pp; English.

The invention relates to anti-HIV-1 group O monoclonal antibodies, which may be used as positive control reagents in immunoassays to detect and differentiate HIV-1 infections. The invention also encompasses a monoclonal antibody which binds specifically to an HIV-1 group O antigen, which has no more than 15% cross reactivity to a corresponding antigen selected from HIV-1 group M antigens and HIV-2 antigens; and a method of using a monoclonal antibody as a positive control reagent in an immunoassay for the detection of anti HIV-1 group O antibodies. The monoclonal antibodies are useful as positive control reagents in an immunoassay involve coupling a monoclonal antibodies. Such immunoassays involve coupling a monoclonal antibodies. Such immunoassays involve coupling a monoclonal antibodies. Such cantibodies of the invention would be used to ensure that the reagents provided to detect HIV-1 group O antibody with HIV group-1 antibodies of the invention would be used to ensure that the reagents provided to detect HIV-1 group O antibody were performing properly. The monoclonal antibodies can be inmobilised on a marita and so constitutes or biological tissues. The monoclonal antibodies can also be used for generating chimeric antibodies for therapeutic use. Different synthetic, recombinant or purified antibodies for therapeutic use. Different epitopes of HIV antigens can be used in combination. The monoclonal antibodies are also useful for differentiating HIV-1 group O antigens of from HIV-2 monoclonal antibodies are also useful for differentiating HIV-1 group O antigens of generate and amplify obNA encoding the native env protein of HIV-1 group O, isolate HAM12. Sequences AA290301 represent PCR primers used in an exemplification of the present invention to generate expression constructs comprising HIV-1 group O envention.

C sequence AA290303 represents a primer of undefined function. (Updated on

Sequences AAC92738-C92817 represent antisense oligonucleotides targetted to the heterogeneous muclear ribonucleoprotein A1 (hnRNP A1) gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human hnRNP A1 mRNA, and were analysed for their effect on hnRNP A1 mRNA levels by quantitative real-time PCR. hnRNP A1 (also known as heterogeneous nuclear ribonucleoprotein core protein A1 and processing (including alternative spliting) of newly transport and processing (including alternative spliting) of newly transport and processing (including alternative spliting) of newly transport and shutles continuously between the nucleus and the cytoplasm acting as an earrier protein for mRNAs. hnRNP A1 also participates in telomere biogenesis, with low levels of hnRNP correlating with shortened telomeres. In addition, hnRNP A1 has also been classified as an apoptosis associated protein on the basis that it is specifically cleaved into three fragments during antibody-mediated apoptosis. Due to its ability to control spliting events, particularly donor splice site selection, hnRNP control spliting events, particularly donor splice site selection, hnRNP control spliting events, particularly donor splice site selection, hnRNP control spliting events, particularly donor splice site selection, hnRNP control spliting events, particularly donor splice site selection, hnRNP control spliting events, particularly donor splice site selection, hnRNP control spliting events, particularly events on and treatment of the invention are useful for diagnosis, prevention and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense compound targeted to human hnRNP A1 which specifically hybridizes with and inhibits the expression of human hnRNP A1, useful for modulating the expression of hnRNP A1 in cells.
                                                    Human hnRNP A1; heterogeneous nuclear ribonucleoprotein A1; heterogeneous nuclear ribonucleoprotein core protein A1; p40CRS; mRNA processing; transport; stabilisation; alternative splicing; donor splice site selection; telomere biogenesis; oncogenesis; apoptosis-associated protein; cancer; tumour formation; expression inhibition; phosphorothioate; antisense oligonucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7401 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical ascendical secting on a disease as well as other treatment. The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclarosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also cuseful in forenais, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism;

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various oblymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vacular diseases, venous thromboembolism pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Probe; quantification; human; GTP binding protein; G protein; alpha subunit; specific mRNA; detection; hybridisation; diagnosis; pathophysiology; disease state; hereditary; cancer; infectious; osteodystrophy; pituitary tumour; acromegaly; melanoma cells; diabetes; PCR; polymerase chain reaction; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The sequences given in AAQ47594-603 show regions of homology between jun sequences and the jun-B specific probe B-1258 which may be of use as jun-B specific probe B-1258 which may be of use as jun-B specific probes. They were used in the method of the invention for the detection and quantification of markha in a sample without the need to purify the mRNA from cells. The claimed method comprises identifying a polynucleotide sequence unique to the mRNA, and immobilising an oligomer complementary to this sequence to an insoluble support. The sample is components are washed from the support such that the unique sequence will hybridise to the bound oligomer and bound RNA is labelled in such components are washed from the support and bound RNA is labelled in such a may that the label is inforced note the support relative to the amount of mRNA on the support. The amount of bound label is then amount of determined. This method can be used for the reliable, rapid, simultaneous determined. This method can be used for the reliable, rapid, simultaneous contention of multiple varieties of mRNA. It may be used for diagnosing and recognition of pathophysiology of various disease states, eg. hereditary diseases, cancer, and infectious diseases. Getiagnosing and recognition of pathophysiology of various disease (of thought to be involved in causing various diseases. Getiagnosing and recognitions of pathophysiology of various disease states. Geticiency of Ge proteins is the molecular basis of hereditary contents multiple varieties of proteins are also involved in invasive and metastatic melanoma cells, and diabetes. See also AAQ47381-666. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Quantitating messenger RNA in sample - using immobilised-polynucleotide having sequence complementary to sequence unique to the MRNA.
                                                                                                                                                                                                                                                                                                                                                      Akitaya T, Cooper A, Mitsuhashi M;

Synthetic

The invention provides polymucleotides corresponding to exon 2 and exon 3 of human leukocyte antigen (HLA) alleles HLA-B*3913, HLA-B*1406 and HLA-B*51 and exon 2 of HLA alleles HLA-DEB1*0820, HLA-DEB1*04 and HLA-DEB1*01. The polymucleotides are useful for typing the above HLA alleles in a sample, especially by a method that comprises (a) amplifying all/part of the relevant sequence using at least one primer pair, and (b) hybridizing the amplified product to set of probes specifically hybridizing to target regions comprising one or more polymorphic nucleotides of the sequence, to determine the absence or presence of the anception preferred primer and/or at least one preferred primer and/or at least one preferred primer and/or at least one preferred probe and (b) for detecting the protein fragment encoded by the probe and (b) for detecting the protein fragment encoded by the pinding specifically to the protein fragment are provided. The polymucleotides also enable the isolation of the complete respective genes from a human genomic library New polynucleotides for human leukocyte antigen, HLA, allele fragments, useful for typing HLA alleles. The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 orphan receptor, EAR3/CHD-TR-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                            Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 17 BP; 2 A; 10 C; 3 G; 2 T; 0 U; 0 Other;

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed of the sequence data for this patent did not form part of the printed of the printed of the present directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

Chen W,

Disclosure; SEQ ID NO 7560; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify concleic acids can be used as probes to detect, characterise and quantify concleic acids can be used as probes to detect, characterise and quantify convide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP concentration and/or amount specifically of hGDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as therapout engagement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration and skeleral muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart of hGDMLP-1 sequence in the spenential cate for this patent did not form part of the printed capture data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence associated with respective conformed the respective of a fitp.wipo.int/pub/published_pot_sequence

```

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 uncleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically proteins, as specific deficiency in hGDMLP-1 proteins, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromesome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO New polypeptide, for raising antibodies that recognize hGDWLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDWLP-1. Disclosure; SEQ ID NO 5989; 214pp; English.

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser descrption ionization, comprises human myosin-like protein hGDMLP-1.
and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as preheargeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymuclectide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in abetronic format directly from WIPO at fitp.wipo.int/published_pot_sequence

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify protein variants having desired phenotypic improvements and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the response or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart of selection miscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the present directly from WIPO at the present directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shared structural features extrongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL gene was important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foctal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL. Example 2; Page 110; 718pp; English.

Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SL, ABB83999), a sequence having 65% sequence identity to (S1), (S1), (S1), having 95% deviations, especially conservative substitutions or a fragment of the sequence comprising at least 8 contiguous amino acids. Human POSHL 11s a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPsses as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) conced by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is treating cancer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating treansgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to between by the European Patent Office

THE SECRET SECRE

The invention relates to a typing kit for judging human leukocyte antigen (RIA) genotype of a sample by hybridising a substrate on which 10-24 base oligomicolotides (AB103612-AB131809) originating in the sequences of genes e.g. belonging to HiA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HiA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals Sequence 17 BP; 3 A; 5 C; 6 G; 3 T; 0 U; 0 Other;

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 40; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for tracting a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2^+. The enzymatic and

```
prostate, coloractal brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paciltaxel, docetaxel, cipplatin, methotrexate, gemcitabine or radiation, fluorouracil carboplatin, methotrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic cid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, crohn's disease, diabetes, obsestiv, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomeruhonephritis, september alway inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Claim 1; Page 298; 387pp; English

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ1, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15p11.2 and MDZ12 is encoded at chromosome 15p26.1, The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3,

MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as theraputic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HTV) or the synthesis, expression and/or stability of Hepatitis C virus (HTV) or the patitis B virus (HTV) RNA. The nucleic acid and such as hammerhead ribozymes, DNAzymes, and enzymatic nucleic acid such as hammerhead ribozymes. DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. DNAzymes, or are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well transcriptase and/or HBV reverse transcriptase primer sequences, as well on Na. The nucleic acids may be used to modulate the expression of HBV or genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      invention

De Canck I, Mersch G,

New polynucleotides for human leukocyte antigen, HLA, allele fragments, useful for typing HLA alleles. WPI; 1999-634008/54.

The invention provides polynucleotides corresponding to exon 2 and exon 3 of human leukocyte antigen (HLA) alleles HLA-B*3913, HLA-B*1406 and HLA-B*51 and exon 2 of HLA alleles HLA-DRB1*0820, HLA-DRB1*064 and HLA-DRB4*01. The polynucleotides are useful for typing the above HLA alleles in a sample, especially by a method that comprises (a) amplifying all/part of the relevant sequence using at least one primer pair; and (b) Claim 16; Page 18; 62pp; English.

hybridizing the amplified product to a set of probes specifically hybridizing to target regions comprising one or more polymorphic nucleotides of the sequence, to determine the absence or presence of the allele in the sample. Diagnostic kits for (a) typing the alleles comprising at least one preferred primer and/or at least one preferred primer and/or at least one preferred probe and (b) for detecting the protein fragment encoded by the polymucleotides, comprising an antiserum or ligand (e.g. antibody) binding specifically to the protein fragment are provided. The polymucleotides also enable the isolation of the complete respective genes from a human genomic library 8×36666666666888

(WRIG/) WRIGHT (VOYTAS

Wright DA, Voytas DF; WPI; 2000-105586/09. New nucleic acid molecules for imparting agronomically significant characters to plants, especially soybean.

Claim 1(a); Page 72; 118pp; English.

This oligonucleotide represents a soybean retroelement primer binding site (version 2). The invention provides molecular tools in the form of site (version 2). The invention provides molecular tools in the form of retroelements and plants.

Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically, capacitation characteristic. In a preferred method, a helper cell line which expresses gag, pol and env sequences is used to enable transfer of which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an agronomically significant can and integration. Claimed isolated mucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, reverse transcriptase, protease or RNAse-H sequence (see AAZ5254-661). Also provided are plant retroviral particles that are used to transfer the nucleic acids into plant cells

Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipidasses, stroke, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, cardiovascular treatment or prevention of diabetic atherosclerosis, neurovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of zmaxl and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HBM systems can be used as surrogate markers in pharmaceutical development, in diagnosis of human or animal bone disease, and in the treatment of bone disease. Sequences ABK22776-ABK23411 represent cDNA molecules encoding human Zmaxl and HBM, and PCR primers, probes, linkers and adapters of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying molecules involved in lipid regulation, useful for diagnosing, treating or preventing e.g., arteriosclerosis, compidentifying a molecule that binds to high bone mass gene or its corresponding wild type gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3.2%; Score 13.8; DB 1; Length 18; 88.2%; Pred. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosas, Pager's disease, sclerostosis, osteomalacia and fibrous dysplasia. ABA82038 to ABA82038

New truncated neublastin polypeptides lacking one or more amino-terminal amino acids of a mature neublastin polypeptide useful for treating neurodegenerative disorders, e.g. peripheral neuropathy, neuropathic pain, brain injury.

Disclosure; Fig 8; 138pp; English.

The invention relates to a truncated neublastin polypeptide comprising an amino acid terminus that lacks one or more amino-terminal amino acids of a mature neublastin polypeptide. The polypeptides and nucleic acids are useful for treating neurodegenerative disorders such as ischemic neuronal damage, traumatic brain injury, peripheral neuropathy, neuropathic pain, Alzheimer's disease, Huntington's disease, Parkinson's disease, amyotrophic lateral sclerosis, memory impairment, disbetes, rend diseases, or glaucoma by moderating metabolism, growth, differentiation or survival of a nerve or neuronal cell. This polynucleotide sequence is a neublastin PCR primer of the invention

WPI; 2003-129278/12.

New transgenic animals (e.g. mice), useful as models for studying bone density modulation, developing drugs for treating or preventing bone diseases (e.g. osteoporosis), or diagnosing diseases characterized by reduced bone density.

Disclosure; Page 57; 603pp; English.

The invention relates to novel transgenic animals expressing the high bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRPS or LRP6, or expressing comprising an alteration of the gene encoding LRPS or LRP6, or expressing to make the study of bone density modulation. The transgenic animals are for the study of bone density modulation. The polymucleorides of the invention may have a use in gene therapy. The transgenic animals and muchical act of the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals of the same species in more than one parameter selected from bone density, bone size, or bone tissue connectivity. The transgenic animals, nucleic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for disposing diseases in more development, or characterised by reduced bone density or mass. The present sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosting a HBM-like phenotype in a subject and for preparing a composition for modulating benoe mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRPS) gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This 3'-PCR primer is used in a novel method for identification of allele types (in this case human leukocyte antigen (HiA) class II gene alleles) of a known polymorphic genetic locus in a sample. The allele type is identified by first combining the sample with a sequencing reaction mixture containing a polymerase, nucleoside feed stocks, one type of suitable for template dependent primer under conditions suitable for template dependent primer extension to form a number of oligonucleotide fragments of differing lengths, which are then evaluated or a denanturing gol. This determines the position of the type of base corresponding to the chain terminating bases in the primer. However, this method differs from standard sequencing procedures, instead of performing
                                                                                      The murine major histocompability complex interferon-stimulated response element (MHC IRSE) binding sequence (AAT41709) was used as a probe to determine whether novel mouse lymphocyte-specific interferon regulatory factor (LSIRF) (see also AAR99426) is a DNA binding protein. LSIRF polypeptides were incubated with 32P- labelled double-stranded probe and, in some cases, with unlabelled competitor DNA fragments (see also AAT4170-16). Gel shift assays showed that the MHC ISRE sequence binds LSIRF protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polymorphic genetic locus - used allele determination.
genes for murine lymphocyte specific interferon regulatory factor d for modulation of lymphocyte activation and proliferation.

and evaluating four concurrent reactions, the sample is concurrently combined with at most three sequencing reaction mixtures containing different types of chain terminating nucleosides. The method can be used for the evaluation of polymorphic sites, and for determining the allelic type of a polymorphic gene. The methods are particularly useful for determining the HLA allele present in a sample
                                                                                                                                                                                                                                                                                                                                                                                                  Filamentous flower; FIL protein; agriculture; gardening; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci array is useful for genotyping a nucleic acid sample a one or more loci anglify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to

```
The invention relates to prognosis or diagnosis of muscular steatosis by measuring the level of a muscular steatosis modulating factor (MSMF) in a human or animal and comparing this with the level in a healthy control. Any difference indicates presence of, or predisposition to, muscular steatosis. The method is particularly used for diagnosis or prognosis of muscular steatosis in mammals and birds, e.g. to select individuals as foundars in animal breeding. Also (ant)agonists of MSMF can be used to treat, or induce (for increasing the fat content of food) muscular steatosis, in humans and animals. The MSMF markers are also useful in the study of diseases and conditions such as obesity, hyperlipidaemla, atherosclerosis, wound healing, tumours and amyotrophic lateral sclerosis invention from its gene
                                                                                                                                                                                                     Prognosis and diagnosis of muscular steatosis, useful e.g. for selecting animals for breeding, by measuring levels of specific markers, also treating or inducing steatosis.

The invention relates to a substantially pure neuregulin (NRG)-2

CD CD VRG-2beta (Cone 2DY) and the polymolectides encoding the Also

CC ON NRG-2beta (Cone 2DY) and the polymolectides encoding the Also

CC included are a vector expressing the protein, a host cell comprising the

CC included are a vector expressing the protein, a host cell comprising the

CC detains a knockout mutation in one or both NRG-2 allelses and an anti-NRG-2

CC having a knockout mutation in one or both NRG-2 allelses and an anti-NRG-2

CC diagnosing an increased likelihood of developing a NRG-2-related disease

CC diagnosing an increased likelihood of developing a NRG-2-related disease

CC diagnosing an increasing the

CC diagnosing an increasing the condition in a test subject. NRG-2 is useful for increasing the

CC mitogenels, survival, growth or differentiation of a cell (e.g. a

CC useful for treating diseases and disorders such as cardiomyopathy

CC useful for treating diseases and disorders such as cardiomyopathy

CC trauma or heart failure or which has a condition affecting smooth muscle

CC trauma or heart failure or which has a condition affecting smooth muscle

CC trauma or heart failure or which has a condition affecting smooth muscle

CC trauma or heart failure or which has a condition affecting smooth muscle

CC and degenerative congenital vascular lesion, vascular hypertension,

CC and degenerative disorder, peripheral neuropathy, a sensory nerve fiber

CC comprising inhibiting proliferation of a tumour cell, preferably a glial

CC comprising inhibiting proliferation of a tumour cell preferably a glial

CC comprising inhibiting proliferation of a tumour cell, correcting of neurofibromatosis by inhibiting glial cell

CC structure of cDNAs encoding NRG-2

CC structure of cDNAs encoding NRG-2

The invention relates to a novel method for obtaining typing information about several variable sites within target nucleic acid, or typing one or more nucleic acid molecules. The methods of the invention are useful for typing one or more nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing two or more variable variable sites are typed, where three or more primer extension reactions are performed. The method is also useful for diagnosis of pathological conditions characterized by the presence of specific nucleic acid molecule(s). The methods are particularly suited for identifying microbial species or this usbtypes, and in typing procedures e.g. typing of polymorphisms, tissue typing or in clinical applications. The sequence represents a PCR primer used in the invention to amplify a specific target region of genomic DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Adeno-associated virus; AAV; integration locus; CpG island;

This invention describes the isolation of a novel HIV-type retrovirus called MVP-5180/91 (ECACC V 92092318). Antigens produced from this product can be used in an assay kit for detecting antibodies against viruses that cause immune deficiency, preferably where the assay is a Western blot, ELISA or fluorescence immunoassay. MVP-5180/91, cDNA and/or antigen can be used for detecting retroviruses that cause immune deficiency and to prepare vaccines. This sequence represents a PCR primer used in the method of the invention. (Updated on 20-MAR-2003 to correct PF field.) (Updated on 20-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Retinal calcium channel; RCC gene; alphalF-subunit; retinal disorder; myopia; nystagmus; strabismus; calcium-regulated development pathway; eye disorder; human; CACNAIF; CSNB; mutational analysis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                 New HIV-type retrovirus and corresponding cDNA, recombinant DNA and antigen - used for detecting retro-viruses that cause immune deficiency and to prepare vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primers SS01 (given in AAQ76031) and SS02 (AAQ76032) were.used for the PCR amplification of a target region (AAQ76037) in the cytosine-DNA-methyltransferase of N. gonorrhoeae. Probe SS06-T5 (AAQ76033) is specific for a region in the amplified sequence, and is used to identify N. gonorrhoeae. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PA field.)

The invention provides a DNA molecule comprising a sequence of nucleotides encoding an alphalF-subunit of a mammalian retinal calcium channel (RCC), including a human alphalF-subunit, a murine alphalF-subunit and orthologs of the human and murine alphalF-subunits. The RCC gene may be used to develop products for diagnostic tests, for incomplete cSMB and risk assessment in affected families. The RCC gene can provide information as to the basic defect in this retinal conditions, which could lead to effective methods for treatment or cure of the disorder. As the associated features of myopia, nystagmus and strabismus frequently observed in patients with incomplete CSMB may be caused by calcium-requiated development pathways, identification of the RCC gene may help to elucidate the molecular details of eye development and which may lead to treatment for related eye disorders or diseases. Sequences AAZ46563-650 represent human CACNALF (alphalF-subunit of RCC gene) exon-specific CPCR primers, used for mutational analysis in humans
                                                                                                                                                                                                                                                                                                                              New isolated mammalian retinal calcium channel gene, used to develop products for the diagnosis and treatment of incomplete congenital stationary night blindness and related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20 BP; 4 A; 8 C; 4 G; 4 T; 0 U; 0 Other;

New avian paramyxovirus cDNA, useful for production of vaccine against Newcastle disease virus.

This invention describes a novel avian-paramyxovirus cDNA (I) which comprises a nucleic acid sequence corresponding to the 5' terminal end of the genome of avian-paramyxovirus allowing the generation of an infectious copy of avian-paramyxovirus. The cell line is useful for the production of infectious lentogenic NDV (Newcastle Disease virus) without the addition of exagence proteolytic activity. Also it is possible to generate a stable transfected cell line that expresses the wild-type F protein in the virus envelope therefore providing infectious particles, useful in the form of a vaccine, especially adding respiratory and/or gastrointestinal diseases. NDV can be easily cultured to very high titers in embryonated eggs. Mass culture of embryonated eggs is relatively cheap. NDV vaccines are relatively stable and can be simply adminiscered by mass application methode e.g. darinking water or by spraying or by aerosol formation. The natural route of infection is by the respiratory cand/or gastrointestinal tract which are also the mady or routes of infection of many other poultry pathogens. NDV can induce local immunity despite the presence of circulating maternal antibody. AAZ44512-Z44609 and AAZ44618-Z44560 represent primers used in the isolation of the NDV strain Lascha cannones. strain LaSota genome

New Enterococcus faecalis aminoacyl-tRNA synthetase proteins and nucleic acids useful for separating amino acids which they specifically recognize, in quantifying amino acids and ATP, or for detecting protein inhibitors.

Example 3; Col 41; 88pp; English.

The present invention relates to Enterococcus faecalis aminoacyl-tRNA synthetases are useful in the biochemical

Page

```
separation of the amino acid which they specifically recognise and in identifying inhibitors ocid and APP, and for detecting and the amino acid and APP. And for detecting and these enzymes can be because the potential inhibitors of these enzymes can be screened for antimicrobial or antibiotic effects, without requiring the culture of pathogenic strains of Enterococcus. The purification and study of the enzymes can be made and used in the purification of protectine or to Diypeptides, and the aninoacyl-tRNA synthetase genes may be used as probes to identify DNA fragments encoding the corresponding aminoacyl-tRNA synthetase gene from other species of enterococci by specific hybridisation. The present sequence is a PCR primer which is used for amplifying the C-terminal Enterococcus facecalis phenylalanyl-tRNA synthetase (PherS) DNA

Oligodeoxynucleotides for inducing an immune response to treat and prevent an allergic reaction, cancer, an autoimmune disorder and symptoms resulting from exposure to bio-warfare agents, comprise multiple CpG AASO9551-AASO9662 represent oligodeoxynuclectides (ODN) of at least 10 nuclectides comprising multiple CpG sequences, where one of the CpG sequences is different from another of the multiple CpG sequences. The ODN are useful for inducing an immune response, preferably a cell-mediated immune response, preferably a cell-mediated immune response, involving non-B cell activation, interferon Claim 5; Page 44; 48pp; English. sednences

cell activation, antibody and interleukin-6 production in a host, for treating, preventing or ameliorating an allergic reaction, e.g. asthma, cancer, e.g. solid tunnour cancer, a disease associated with the immune cancer, e.g. solid tunnour cancer, a disease associated with the immune system e.g. autoimmune disorder or an immune system deficiency, infection or a symptom resulting from exposure to bio-warfare agent in a human. The condition of immune response improves the efficacy of a vaccine and is used in antisense therapy. The OND are useful for treating preventing cused in antisense therapy. The OND are useful for treating preventing or ameliorating allergic reactions, including eczema, allergic rhinitis or coryza, hay fever, bronchial asthma, untitarial (hives), food allergies and other atopic conditions, for improving the efficacy of vaccines against hepatitis A, B and C, human immunodeficiency virus (HIV) and calaria, for treating immune system deficiencies, e.g. lupus cervitations and autoimmune diseases such as rheumatoid arthritis and multiple sclerosis, infections including Francisella, schistosomiasis, tuberculosis, acquired immunodeficiency syndrome (AIDS), Leishmania and symptoms resulting from exposure of bio-warfare agent, including Ebola, conditions and Listeria response involving B

Novel antisense compounds for modulating the expression of Survivin and treatment of cancer.

Example 18; Page 60; 120pp; English.

The invention relates to antisense oligonucleotides targeted to a nucleic acid molecule encoding human Survivin, where the antisense oligonucleotide inhibits the expression of human Survivin. These antisense oligonucleotides are used in the treatment of an animal suffering from a disease or condition associated with Survivin, e.g. a hyperproliferative condition such as cancer, and comprises administering a therapeutically or prophylactically effective amount of the antisense oligonucleotide so that expression of Survivin is inhibited. The

Candida albicans GRACE strain PCR primer SEQ ID NO 4516.

oligonucleotides can also be used to treat a human suffering from a disease or condition characterised by a reduction in apoptosis comprising administering the antisense oligonucleotide to a human. In addition, the antisense oligonucleotide and a cytotoxic chemotherapeutic agent e.g. taxol or cisplatin, can be used to modulate apoptosis, cytokinesis or the cell cycle, or inhibit the proliferation in a cancer cell by contacting the cell with the antisense oligonucleotide. AAS21521-AAS21768 represent Survivin nucleic acids, and antisense oligonucleotides targeted to Survivin, used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a microarray of oligonuclectides comprising probes for the human HLA Class I genes attached to a solid support. These can be used in HLA typing. Oligonuclectide arrays are also useful in large scale gene discovery, monitoring gene expression, polymorphism detection and gene mapping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotide arrays useful for human leukocyte antigen (HLA) tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             typing, comprises HLA class I oligonuclectide probes representing all known polymorphisms in HLA class I locus, on a solid support.
                                                                                                                                                                                                                                                               0; Gabs

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or teplacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells in which both alleles of a gene are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that is essential to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a mammalian disease. (M1) is useful for identifying a compound which modulates the compound catabolism, biosynthetic, transporter, transcriptional, compound extabolism, biosynthetic, transporter, transcriptional, transduction, DNA replication and cell division compound stabolism, biosynthetic, transporter, transcriptional, transduction, both relativing a compound having the ability to inhibit growth of relativing a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of the primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                        Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or treplacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are useful for identifying a gene that cells in which both alleles of a gene are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus to an antifungal agent that inhibits the growth of a diploid fungus to an antifungal agent that inhibits the growth of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNX replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treatment is not represented in the present sequence at for present cell in the Buropean Patent Office on sequence information supplied to Derwent by the Ruropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                              Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

AAD45182,

Human RIP2 antisense oligonucleotide ISIS #104252.

27-DEC-2002 (first entry)

AAD45182;

```
New antisense oligonucleotide that targets regions of a nucleic acid encoding human receptor interacting protein (RIP)2, for treating diseases associated with RIP2 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to antisense compounds targetted to a nucleic acid encoding human receptor interacting protein (RIP)2 to inhibit its expression. Antisense compounds are used for treating diseases associated with RIP2 expression. They are also useful in antisense gene therapy. The present sequence is an oligonucleotide targetted to human RIP2 DNA

The invention relates to a novel isolated nucleic acid molecule comprising a sequence that encodes a thioesterase or thioesterase domain, derived from a bacterial daptomycin bloopyntheric gene duster. The proteins of the invention have antibacterial, fungicide, virucide, antiparasitic, immunomodulator, antibacterial, fungicide, virucide, compositions and have a use in gene therapy. The compositions and methods of the present invention are useful for generating novel linear and cyclic peptides and improving yield of a product in a cell expressing an daptomycin non-ribosomal peptide synthetase (NRFS) to be used as new compounds or in producing new compounds, such as antibiotics, antitumour agents, antifungals, antivirals, antiparasilics, antimitotics, antitumour agents, immunomodulatory agents, anti-cholesterolemic agents, siderophores, approachemicals and synostatics. The sequence represents a PCR primer used in the invention to amplify the S. roseosporus daptomycin blosynthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated nucleic acid molecule from a bacterial daptomycin biosynthetic gene cluster encoding a thioesterase or thioesterase domain, useful for generating novel linear and cyclic peptides, and products in a cell.

The present invention describes a method (M1) for designing capture oligonuclectide probes (II) will hybridise with little mismatch, where cligonuclectide probes (II) will hybridise with little mismatch, where coligonuclectide probes (II) will hybridise with little mismatch, where coligonuclectide probes (II) will hybridise with little mismatch, where coligonuclections deserved within a narrow range. The method is useful infectious agents e.g. Cryptococcus neoformans, Candida albicans and infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Bestein-Barr virus and polio virus, and parabitic infectious agents confined is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Confecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAl gene, psi gene, human papilinaavirus types 16 and 18 and liver cancers. The cancer is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the control problem of the oligonucleotide probe presence or absence of the target uncleotide sequences. All SO74 to a presence or absence of the target uncleotide sequences. All so in a contraction of the oligonucleotide problem.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dystunction and a second active agent comprising an entilnflammatory steroid and ubjquinone. A composition of the invention has antiinflammatory, antiallargic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an application of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubjquinone or lung surfactuant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

```

```
The present invention describes a method and a kit for determining the expression of mRNA or cDNA of a protein participating in the maintenance of skin structure. The method is quantitative, simple and accurate in the determination of extracellular matrix components of laminin 5 chain genes LAMA3, LAMB3 and LAMC2, matrix metalloproteinases MMP-1, MMP-2, MMP-3 and MMP-9, VII collagen, type I collagen alpha 1 chain, type I collagen alpha 1 chain, type IV collagen alpha 1 chain, type IV collagen alpha 2 chain, TIMP-1, TMMP-3 and TIMP-3. ACF57290 represent PCR primers and probes used in the method of the

```
New compound, having a sequence targeted to a nucleic acid encoding mucin 1, transmembrane, useful for preparing a composition for treating hyperproliferative or inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to antisense oligonucleotides targetted to a nucleic acid encoding mucin 1 transmembrane (also known as WCT, epistalin, epitectin, polymorphic epithelial mucin; PEM, peanut-reactive urinary mucin; PUM, epithelial membrane antigen, BEM, PAS-0, NCRC11, H23 antigen, H23-EFA transmembrane antigen, PFB antigen and CD227) to inhibit/modulate the expression of mucin 1 transmembrane. Antisense compounds of the invention are useful for preparing compositions for transmet hyperproliferative or inflammatory disorders. The invention is also used in gene therapy. The present sequence is human mucin 1 transmembrane antisense oligonucleotide

New antisense oligonucleotides targeted to a nucleic acid molecule encoding complement component C3, useful for treating a disease or condition associated with complement component C3, e.g. autoimmune

Claim 3; Page 27; 72pp; English.

disorder or infection.

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding complement component C3. The compound complement component C3 and inhibite the expression of complement component C3 or specifically hybridises with at least an 8-nucleobase component C3, or specifically hybridises with at least an 8-nucleobase component C3. Also included are a composition comprising complement component C3. Also included are a composition comprising the component C3 in calls or tissues (comprising the expression of complement component C3 in calls or tissues (comprising contacting the cclls or tissues with the compound cited above) and treating an animal compounds are useful for inhibiting the expression of complement component C3 comprising deministering to the animal the compound cited above so that expression of complement component C3 is inhibited. The antisense compounds are useful for inhibiting the expression of complement c3 in cells or tissues, or for treating an animal having a disease or condition associated with complement component C3 such as an expression of complement c3 in cells or tissues, or for treating an animal having a disease or condition associated with complement component C3 such as an expression of capan failure, component C3 in cells or tissues, or for treating an animal having a disease or condition associated with complement component C3 such as an expression of capan failure and C4 of various members of a biological pathway, or for preventing or delaying the expression of infection, inflammation or tumour formation. The componence is an expression of infection or tumour formation. The present sequence is an expression or income capan pathway, or for preventing or delaying an expression or income capan path and delaying and expression or tumour formation. The present sequence is an expression or income capan path and Sequence 20 BP; 4 A; 9 C; 3 G; 4 T; 0 U; 0 Other; antisense oligonucleotide targeting mouse C3.

```
The present invention describes a method for inducing the production of vascular endothelial growth factor (VEGF) by a cell comprising contacting the cell with a CpG oligonucleotide and therefore inducing the production of VEGF by the cell. Also described: (1) inducing neovascularisation in the cell into an area of the tissue, comprising introducing a CpG oligonucleotide into an area of the inducing neovascularisation in the whole wessels is desired, and so inducing neovascularisation in the subject where angiogenesis is desired, comprising introducing a CpG oligonucleotide to the area, and so promoting angiogenesis in the subject where angiogenesis is desired, comprising introducing a CpG oligonucleotide to the area, and so promoting angiogenesis in the subject; and (3) screening for an agent that inhibits neovascularisation, comprising administering the agent to command, where inhibition of angiogenesis in the animal indicates that the mammal, where inhibition of angiogenesis in the animal indicates that the captorides can be used in gene therapy. The method and the CpG oligonucleotides can be used in inducing angiogenesis or coligonucleotides can be used in inducing angiogenesis or exhibit male pattern baldness, or subjects who have a wound or who have constituted and the inhibit neovascularisation. The present sequence for agents that inhibit neovascularisation. The present sequence

Following digestion of the amplified product with a restriction endonuclease (e.g. HaeIII), which is not capable of digesting herpes simplex virus (HSV)-1 and HSV-2, the digested fragments may be separated by size or may be hybridized with end-labelled oligonucleotide probe [85].

The present sequence is an antisense oligomuclectide specific for the HIV target site, tat, which can be used for the detection of HIV, or for the treatment of HIV infection. The oligomuclectide has an average EC(90) (IM) of 1500, which refers to the conc. of oligomuclectide required to achieve 90 % inhibition of HIV p24 core antigen prodn. (contg. phosphorothioate linkages only)

The present sequence is an oligomucleotide complementary to an antisense oligomucleotide specific for the HIV target site, tat, which can be used for the detection of HIV, or for the treatment of HIV infection. The DNA equivalent of the antisense oligomucleotide has an average EC(90) (mN) of 1500, which refers to the conc. of oligomucleotide required to achieve 90 % inhibition of HIV p24 core antigen prodn. (contg. phosphorothicate
                                                                                                                                    The present sequence is an antisense oligonucleotide specific for the HIV target site, tat, which can be used for the detection of HIV, or for the treatment of HIV infection. The invention provides the Simian herpesvirus B DNA (AAV33167) sequence coding for a gB glycoprotein (UL27; AAW70293) and a portion of an ICP 15. Kba protein (UL28; AAW70294). The invention uses these DNA and protein sequences as a basis for the development of differential diagnostic tests for the rapid identification of Simian herpesvirus B cases. Primer BV1 (AAV33169) and BV2 (AAV33169), along with the Simian herpesvirus B sequence specific PBs probe (AAV33179), were used in these diagnostic tests. Other primer sets used were the sense primers B3 (AAV33171) or B3' (AAV33172) and antisense primers B4 or B4' (AAV33174). Therefore, the virus can be detected by detecting the DNA sequence and knowledge of the amino acid sequence will help in the design of DNA production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Monkey herpes B virus DNA - coding for gB glycoproteins and polypeptides.

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine cytostatic applied (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate
                                                                                                                                                                                                                           The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used in forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                           disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New use of irinotecan for preparation of compositions for treating in subject having genome with variant allele comprising cytochrome subfamily IIIA, polypeptide 5 polymucleotide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cancer; CYP3A5; irinotecan; pharmaceutical; malignant glioma; cytochrome p450; subfamily IIIA; nifedipine oxidase; polypeptide cytostatic; PCR primer; 8s.
                                                                                 New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                    The present sequence is a PCR primer used for amplifying human mammary gland cancer specific gene (MSG) CDNA. MSG is useful for diagnosing, detecting, monitoring, treaging, incaping and treating mammary gland cancer in a patient by determining the levels of MSG in cells, tissues or bodily fluids in a patient and comparing the determined levels of MSG with levels of MSG in cells, tissues or bodily fluids from a normal human control, where a change in determined levels of MSG in the patient versus normal control is associated with the presence of mammary gland cancer. MSG is used for identifying potential therapeutic agents for use in imaging and treating mammary gland cancer. MSG and treating mammary gland cancer in a patient. MSG vaccine is useful for treating mammary gland cancer in a patient. MSG vaccine is useful for inducing an immune response against a MSG protein and for treating mammary gland cancer in a patient. MSG and its protein and for treating mammary gland cancer in a patient. MSG and its protein and for treating mammary gland cancer and for diagnosis and treatment of disorders of cells,

New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome p450, subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.

Disclosure; Page 32; 86pp; English.

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of the treatment with substances (nonresponders), as well as the development of charge resistances and ABM34912 to ABM36013 represent sequences used in the exemplification of the present invention

The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIAL gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIAL gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancraatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ss; irinotecan; cancer; UGTIA1; cytostatic; topoisomerase I inhibitor; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; uridine diphosphate glycosyltransferasel member Al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               / Match 3.2%; Score 13.8; DB 1; Length 21; Local Similarity 78.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for the use of irinotecan (1) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) golynucleotide (II). (I) has expostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1 polynucleotide.

The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTAH gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTAH, gene. The invention has cytostatic activity. A composition of the invention acts as a topoisocmerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Seguence 21 BP; 0 A; 6 C; 8 G; 6 T; 0 U; 1 Other;

New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising

multidrug resistance 1 polymucleotide.

Disclosure; Page 69; 130pp; English.

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gateric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance I (MDR1) polymucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the invention.

The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant allel and subject having a genome with a variant allele which comprises a multidrug resistance 1 (MRM1) polynucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                             irinotecan; colorectal cancer; cervical cancer; gastric cancer;

Comparative analysis of regions close to both the 3' and 5' ends of small subunit ribosomal RNA sequences with near identity in the enkaryotic kingdom identified two consensus sequences, ERIB 1 and ERIB 10, spanning the serRNA gene sequence. These primers may be used in PCR to selectively mapped from a multiply the serRNA genes contained within the genomic DNA prepach from a number of Einmeria species, to determine the degree of similarity between serRNA from different Einmeria species. The probe CommonARC represents a sequence common to all Einmeria species which may be used to identify Einmeria infection. See also AAQ3128-332. NOVE: As specifications EP-516381. EP-516383-6, EP-516381 and EP-516395-6 are identical except in the claims section, sequences for all these specifications can be found indexed under EP-516385. However the claims dequences of each specification will be indexed under their own patent number, thus each specification will be indexed under their own patent number, thus each missing OS field,) (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PI field.)

Oligo-nucleotide(s) able to inhibit multi:drug resistant phenotype - either by anti:sense or aptameric effects, useful for enhancing cytotoxic effects of chemotherapeutic agents on multi:drug resistant cancer cells.
                                                                                                       Recombinant glutaminase derived from Pseudomonas 7A - expressed in E. coli to increase yield and avoid Pseudomonas endotoxins for antiviral and anticancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /*tag= a //tag= a //t
                                                                                                                                                                                                                                                                   Chromosomal DNA from Pseudomonas sp. 7A (ATCC 29598) was used to construct a genomic library in Escherichia coli LE392. Screening with mixed oligomucleotide probes was used to isolate a gluteminase-encoding clone. This was sequenced using the primers given in AAQ68439-47. The gene can be used to manufacture recombinant glutaminase, free of Pseudomonas exotoxin, for use in e.g. HIV and cancer therapy. The gene may also be used in gene therapy protocols. (Updated on 25-MAR-2003 to correct PN field.)

These ORFs encode polypeptides (see AAZ015449) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microoragnism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingttis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine, eye disease, conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease, perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                            The present sequence represents a novel oligonucleotide OL(8E)MRP that specifically hybridises in a human cell with a complementary sequence of human multidrug resistance-associated protein (MRP) gene. Hybridisation causes inhibition of expression of the multidrug resistance phenotype by the cell, due to the oligonucleotide having an aptementic inhibitory effect as well as an antisense inhibitory effect. The oligonucleotide definition of assertant phenotype. When co- administered to cancer patients to prevent development of the multidrug resistant phenotype. When co- administered with Chemotherapeutic agents, the oligonucleotide is useful for potentiating elimination of multidrug resistant tumour cells from bone marrow or peripheral stem cell grafts.
                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                             Also, the oligonucleotide can be used as an immunosuppressive agent
                                                                                                                                                                                                                                                                                          ö

These ORFs accode polygeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antiennes and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases uch as conventional trachom, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingtis, perimpgatitis, barbingtis, perimpgatis, in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584 - AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising
                                                                                                                                        Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

The present invention describes a method for distinguishing a human betworpte antigen of alse I antigen or allele by a combination of polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B or -C alleles can be amplified or using reverse hybridisation analysis comprising a DNA probe covalently bonded to microtire plate wells which are hybridisable specifically with the base sequence of at least one specific HLA-A, -B or -C allele. The method is applicable in gene typing, judying donor-recipient compatibility during organ transplant and correlation analysis for diagnosis of various diseases. The method is simple, rapid and accurate, with possibility of mechanisation and techniques. AAA666943 to AAA67072 represent oligonucleotide probes and PCR primers for use in the method of the present invention
                                                                                                                                                                                                                                                                                                           Simple, rapid and accurate method for distinguishing HLA class I allele type with possibility of mechanization and automation, applicable in judging donor-recipient compatibility during organ transplant and disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 *****************
                                                                                                                                                                                                                                                                                                The present invention relates to an expression library comprising synthetic or semi-synthetic mucleic acid sequences, not cloned from an immunized source, where the nucleic acid sequences are derived from mucagenised immunoglobulins that are naturally devoid of light chains. The library is useful for the preparation of antibodies having binding specificity for a target antigen which avoids the need for a donor to have been previously immunized with the target antigen. The recombination of heavy and light chains is avoided, therefore preventing the formation of molecules that are non-functional. The number of hypervariable respectoire of possible binding variants to be obtained. The present sequence is a PCR primer targeted to anchor regions in Ilama antibodies. The primers (AAA73745 to AAA73745) amplified the framework regions in the primers (AAA73745 to AAA73745 amplified the framework regions F1, F2, F2c, F3 and F4. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                       Expression library comprising nucleic acids not cloned from an immunized source, derived from immunoglobulins naturally devoid of light chains, use for producing antibodies specific for a target antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human angiotensinogen gene; AGT; insulin-dependent diabetes mellitus; type 1 diabetes; dhromsome 1462-43; single nucleotide polymorphism; IDDM; SNP; diagnosis; susceptibility; transgenic animal; drug screening; antidiabetic; gene therapy; alternative exon 1; PCR primer; ss.

The invention relates to the human angiotensingen (AGT) gene, some mutant alleles of which cause a susceptibility to insulin-dependent diabetes of which cause a susceptibility to insulin-dependent confabetes mellitus (IDDM, type I diabetes). The AGT gene is located on chromosome 1442-43, a region linked to IDDM. The invention discloses genomic sequences comprising an alternative AGT gene (AAC91600-CC G91604) and a genomic sequence comprising an alternative AGT gene (AAC91600). The invention also encompasses the specifically claimed human AGT mutant nucleic acid sequences AAC91667-C91684, and the wutant confection mutant AGT alleles or gene products thereof which are related to detecting mutant AGT alleles or gene products thereof which are related to detecting mutant AGT alleles or gene products thereof which are related to confection of a polymorphism in the AGT gene; and methods of screening for drug candidates which may be useful in the treatment of diabetes resulting from an AGT mutation. Methods of preventing or treating diabetes are claimed which comprise the administration of a compound which agonises or antagonises wild-type or mutant AGT, which agonises or antagonises wild-type or mutant AGT, which agonises a transgenic non-human animal, or cell line derived compasses a transgenic non-human animal, or cell line derived compasses a transgenic non-human animal, or cell line derived compasses a transgenic non-human animal, or cell line derived care useful for secreening compounds which bind to AGT correcting or fragments thereof are useful for secreening compounds which bind to AGT correcting or fragments thereof are useful for secreening compounds which bind to AGT proteins or fragments thereof are useful for secreening compounds which bind to AGT proteins or fragments thereof are useful for secreening compounds which bind to AGT proteins and the pagence are useful for secreening of the invention of the invention
Novel angiotensinogen gene, mutant alleles of which causes susceptibility to insulin-dependent diabetes mellitus useful for diagnosis of predisposition to diabetes.
                                                                                                                                                                                                                                                                                    Example 2; Page 33; 83pp; English.

Novel isolated polypeptide comprising variant form of mouse or human SAC1 polypeptide, and is associated with altered preference for carbohydrates or other sweeteners, useful for preventing obesity, diabetes, alcoholism.

Claim 14; Page 75; 239pp; English.

The invention relates to an isolated polypeptide, comprising a variant form to f mouse or human SAC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obssity, diabetes or alcoholism associated with SAC1 expression. The sequences are useful in creening for drugs and sweeteners. Recombinant cell lines and transgenic mbryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SAC1 gene. A sequence variation of the SAC1 locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymulectide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes

Determining mutation in DNA, comprises attaching guanine-cytosine-rich clamp to DNA, fluorescently labeling DNA and mixing it with denaturant,

heating to melt DNA and comparing melting temperatures of DNA and its wild type.

Example 3; Col 10; 16pp; English.

PCR primers ABL41762-64 were used to amplify exon 2 of the N-RAS protooncogene, in the course of the invention. The specification describes a
method for determining whether a DNA sequence contains an alteration. The
method comprises attaching a DNA sequent comprising one or more copies of
the DNA sequence to a guanine-cytosine-rich clamp, fluorescently labeling
the DNA sequence to a quanine-cytosine-rich clamp, fluorescently labeling
the DNA sequence to a guanine-cytosine-rich clamp, fluorescently labeling
and comparing the melting temperatures of the DNA segment and a wild type
alteration in the DNA sequence. The method is useful for determining
whether a DNA sequence contains an alteration. The method is suitable for
detecting a mutation as small as a single base substitution in a
relatively large DNA fragment. As the disparity in melting temperatures
is most evident in a lower melting domain of a DNA fragment, it is
possible to distinguish single base substitutions within lower melting domain

```
The present invention describes a method for producing homozygous stem (HS) cells having a target genotype and/or immunotype from non-fertilised post-meiosis I diploid germ cells by mitotically activating the germ cells to develop multiple blastocyst-like masses, each of which contains an inner cell mass (ICW) that is homozygous for the target genotype and/or immunotype. The methods of the present invention are useful for the production of HS cells utilised for diagnosis, therapeutic and cosmetic transplantation, cell replacement and/or gene therapy, and the treatment of various genetic diseases (Cystic fibrosis, muscular disease, Parkinson's disease and multiple sclerosis), traumatic injuries (post-traum repair and reconstruction, limb replacement, spinal cord injuries and burns), cancer, disorders of the epithelium (blindness, myopathy, atherosclerosis), Crohn's disease, autoimmune diseases and anaemia. ABQ74028 to ABQ74115 represent PCR primers and sequence specific oligonucleotide (SSO) probes which are used in the

A composition of the invention has antiinflammatory, antialergic, antiasthmatic, hypotensive, went an antistlammatory and cytotatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or use in antisense gene therapy. The composition is useful for treating or use in antisense gene therapy. The composition of confiction, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or arespiratory disease or condition.

Co lung surfactant in a was obtained in electronic format directly from WIPO Ext. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO Ext.

New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.

Example 15; Page 85; 139pp; English.

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 623.1, and is also known as ctgrefact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBF-FP2, IGFBF

The invention relates to antisense compounds targeted to nucleic acids encoding protein kinase A regulatory subunit RII alpha. The antisense compounds are useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha and for treating a disease or condition associated with expression of PKA regulatory subunit RII alpha. The compounds are also useful as research reagents and kits, or for diagnostics, therapeutics and prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human protein kinase A regulatory subunit RII alpha

The invention relates to a method of identifying one or more biomarker genes for a type of cells among a group of (m) different cell types, from a multiplicity of genes whose expression levels in cells of the group are measured using nucleic acid arrays, to generate a plurality of measurements of expression levels for the m types of cells, by comparing rank order for the gene and (m-1) for each gene and detarmining a rank order for the gene among the multiplicity. The method is useful in identifying biomarkers using nucleic acid microarrays. The biomarkers of skin may be used in molecular diagnostic and pathology applications in normal and abnormal tissues and cell. The biomarker genes may also be used as molecular targets for therapeutics of a disorder or a disease in thumans. This sequence represents a QRT-PCR primer used in the method of the invention.

The present invention describes a novel enzymatic nucleic acid (ENh) having a hammerhead motif (HM) comprising; (i) at least 5 tibose residues (i) in a 2-C-allyl modification at position 4 of the ENh; (iii) at least ten 2-O-methyl modifications; and (iv) a 3'-end modification. The ENh's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENh's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for channing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENh's can also be used in diagnosis Ribozyme therapy impacted on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Arthritic condition; graft tolerance; immune response; target; cleavage;

The present invention describes a novel enzymatic nucleic acid (ENA)
having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
(ii) a 2-C-allyl modification at position 4 of the ENA; (iii) at least
c in 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
membrane of joints for the treatment or prevention of arthritis,
can inhibit collagenase and stromelysin production in the synovial
membrane of joints for the treatment or prevention of arthritis,
particularly ostecarthritis or rheumatoid arthritis. The ENA's can also
be used to treat antigen presenting cells of a donor to induce tolerance
in a recipient to an alloantigen of a donor. They can also be used for
enhancing graft tolerance or for treating autoimmune disease, and for
treating allergies and other inflammatory conditions. The ENA's can also
be used in diagnosis. Ribozyme therapy impacts of the expression of
stromelysin without introducing the non-specific effects upon gene
expression which accompany treatment with retinoids and dexamethasone.
The concentration of ribozyme required to affect a therapeutic treatment
is lower than that required of antisense molecules, and is highly
concentral to the present sequence is used in the exemplification of the

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like drowth Pactor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF45151 and AAF45153-61150 une method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, tuba, pilaris, serborrhoea, keloids, keratosis, chothyosis, pityriasis, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic mission of the inside of blood Example 8; Page 90; 201pp; English.

The invention relates to a method of treating deficiency of insulin, that involves administering a hedgehog protein or nucleic acid encoding the hedgehog protein. The hedgehog proteins neb eused in the method are selected from sonic hedgehog (Shh), indian hedgehog (Ihh) and desert hedgehog (Dhh). The method is useful for treating deficiency of insulin in a patient afflicted with diabetes, by stimulating insulin production in pancreatic beta-cells PBO). It is also used to treat deficiency of insulin in partient, by stimulating IDX-1 production in PBC. The hedgehog protein is useful for modulating IDX-1 gene expression or its protein in PBC. This is used to treat deficiency of PBC in a patient, by stimulating neogenesis form beta-cell pancreatic ductal precursor cells. Inhibitors of the hedgehog proteins are useful for suppressing secretion of insulin in a patient afflicted with hyperinsulinemia. Sequences AAF84001-4002 represent PCR primers for ampliying the rat Dhh cDNA fragment
                                                                                                                                                                                                                                                                                                                                                                       Treating deficiency of insulin, IDX-1 or pancreatic beta cells in a patient by, administering a hedgehog protein, nucleic acid encoding the protein or cells expressing the protein.

```
The present invention describes a human genome-derived myosin-like

protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-

complete acids in gene therapy and vaccine production. The hGDMLP-1

complete acids can be used as probes to detect, characterise and quantify

mucleic acids can be used as probes to detect, characterise and quantify

complete initial substrates for the recombinant engineering of hcDMLP-1

provide initial substrates for the recombinant engineering of hcDMLP-1

complete initial substrates for the recombinant engineering of hcDMLP-1

protein variants having desired phenotypic improvements, and for

expressing the proteins. The hcDMLP-1 proteins or polypeptides may be

completed and a sea standards in assays used to determine the concentration

and/or amount specifically of hGDMLP-1 proteins, as specific biomolecule

complete probes for surface-ahanced laser desorption ionisation, as

therapeutic supplement in patients having specific deficiency in hGDMLP-1

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

complete associated with the expression of hGDMLP-1, in particular heart

and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a

complete represents an oligomer used in the screening of the

hGDMLP-1 sequence in the exemplification of the present invention. N.B.

The present sequence data for this patent did not form part of the printed

specification, but was obtained in electronic format directly from WIPO

The present invention relates to novel human zinc finger-containing corrects and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is proceins and their coding sequences: MDZ3, MDZ4, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p12.2 and MDZ12 is encoded at chromosome 16p2.3 and MDZ3 is encoded at chromosome 16p2.3 and MDZ4, MDZ3, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3. MDZ4, MDZ3, or MDZ12, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids and sloo be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The process are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; immunostimulant; gene therapy; vaccine; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel method for obtaining typing information about several variable sites within target nucleic acid, or typing one or more nucleic acid molecules. The methods of the invention are useful for typing one or more nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing three or more variable sites are typed, where three or more primer extension reactions are performed. The method is also useful for diagnosis of pathological conditions characterized by the presence of specific nucleic acid microbial species or their subtypes, and in typing procedures e.g. typing of polymorphisms, tissue typing or in clinical applications. The sequence specific target region of genomic DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ1; MDZ1; chromosome 7g22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; se.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Typing nucleic acid for obtaining information about several variable sites involves simultaneously or sequentially performing two or more primer extension reactions, and determining the pattern of nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gapa
                                                                        Human, single nucleotide polymorphism; nucleic acid typing; primer, tissue typing; sequencing; angiotensin converting enzyme; ACE; ss.
Human angiotensin converting enzyme SNP-fragment Eu6 primer A063FS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is encoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 17 BP; 4 A; 3 C; 7 G; 3 T; 0 U; 0 Other;

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3,

MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 402; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ3. MDZ3. C encoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6P21.3-22.2, MDZ7 is encoded at chromosome 6P2.3 mDZ7 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, MDZ4 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or devalopmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as

15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The mUZ1s acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZS 9889 - ABZ62216, ABZ64544 - ABZ65531, ABZ65220 - ABZ652246, ABZ652246, ABZ65234, ABZ65230 - ABZ652246, ABZ65234, ABZ65331, ABZ65330 - ABZ652246, ABZ65234, ABZ65331, ABZ65330 - ABZ652246, ABZ65331, ABZ65330 - ABZ65324, ABZ65331, ABZ65330 - ABZ652246, ABZ65331, ABZ65331, ABZ65324, ABZ65334, ABZ65331, ABZ65330 - ABZ653246, ABZ65331, ABZ65331, ABZ65330 - ABZ653246, ABZ65331, ABZ65331, ABZ65330 - ABZ6534, ABZ65331, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ65331, ABZ6334, ABZ6534, ABZ65331, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ6534, ABZ6534, ABZ65334, ABZ65334, ABZ6534, ABZ6534, ABZ65334, ABZ6534, ABZ6534, ABZ6534, ABZ65334, ABZ65334, ABZ6534, ABZ6544, Match 3.1%; Score 13.4; DB 1; Length 17; Local Similarity 80.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

The present invention describes a method for detecting lipid metabolism errors in patients using as indicators a set of 65 specific low density lipoprotein (LDI) receptor gene mutations. The method can be used in the diagnosis of an inherited predisposition to the development of diseases associated with hyperlipaemia, such as arteriosclerosis and ischaemic heart disease. ABL91141 encodes the LDL receptor given in ABB90525. ABL91142 to ABB9183 represent PCR primers used in the amplification of the receptor gene. ABL909090 to ABL91140 and ABB90445 to ABB90524 represents sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Set of specific low density lipoprotein receptor gene mutations for diagnosis of familial lipid metabolism errors including hyperlipemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Σ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Egashira T, Ishihara

The invention relates to KVLQT1 and KCNEI genes, associated with long QT (LQT) syndrome. It provides a mink protein comprising a mutation which substitutes the wild type amino acids with Leu, Asp, Leu, His, Trp and Ala or Thr at residues 74,76,28,32,98 and 127 respectively. Screening KVLQT1 and KCNEI is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. Sequences AAZ90675-Z90706 represent human KVLQT1
                                                                                                                                            encoding minK protein and KVLQT1 protein involved channel formation useful for screening drugs, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 2 A; 8 C; 8 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                    in cardiac potassium channel formation use:
preventing and treating cardiac arrhythmia
                                                                                                                                                                                                                                                                                                     Example 11; Page 69; 167pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       intron/exon junction sequences

New isolated mutant KVLQT1 nucleic acids, useful for developing products for the diagnosis, prevention and treatment of long QT syndrome.

Example 11; Page 72; 178pp; English

The invention relates to KVLQT1 nucleic acids which have a mutation compared to wild-type KVLQT1 (AAZ98901) The KVLQT1 gene encodes a protein of 676 amino acids which forms a cardiac I(ks) potassium channel with the KCNE1 protein (AAY80863). The KVLQT1 gene contains 15 introns and encodes a protein containing 6 putative transmembrane segments and a pore forming region. The gene has been mapped to the chromosomal location 11p15.5. The sequences AAZ8806729836 represent the intron-exon boundaries from the KLVLQT1 genomic sequence. Mutations in the KVLQT1 or KCNE1 genes result in cardiac arrhythmias observed as a prolonged QT curve in electrocardiograms (Long QT syndrome). The genes and proteins can be used to streen for drugs which can be used for treating or preventing long QT syndrome. They can also be used to screen for drugs which can be used for treating or preventing long QT syndrome. The KVLQT1 nucleic acids can be used for gene therapy, and KVLQTI peptides can be used for peptide therapy

The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly And Andrews) polymerases plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonuclectide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, environgacial (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is an antisense oligonuclectide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                       Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 3 A; 7 C; 7 G; 3 T; 0 U; 0 Other;

DNA encoding for a mutant KVLQT1 which causes Jervell and Lange-Nielsen syndrome (JLN) when homozygous, useful for diagnosing long QT syndrome, or diagnosing or prognosing JLN.

```
Example 5; Col 45-46; 58pp; English.
```

KVLQT1 is a cardiac potassium channel and mutations in the KVLQT1 gene cause Jervell and Large-Nielsen Syndrome (JLN). KVLQT1 maps to chromosome 11p15.5. The present invention relates to a mutant KVLQT1 coding sequence (see AAC89914). The mutant KVLQT1 coding sequence is useful in the presence diagnosis of long OT syndrome and in screening humans for the presence of KVLQT1 gene variants which cause JLN syndrome. The present sequence is an exon/intron boundary of KVLQT1 XXX0000000XXX

The invention relates to an antisense oligonucleotide compound of 8 to 50 nucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibits the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 invention specifically hybridises to and inhibits expression of caspase 6 the rerapeutically or prophylactically to treat an animal having a disease or condition associated with caspase 6, such as Rieger's syndrome or axaxia telangiecrasia, hyperproliferative disorder, a haematopoietic disorder, a bone metabolism or cholesterol disorder, various types of cancer, neurological conditions such as Alzheimer's disease and other deregulated apoptoric pathological conditions. This polynucleotide sequence represents a mouse caspase 6 oligonucleotide sequence has 2' MOE wings and NOTE: This phosphorothioate oligonucleotide sequence has 2' MOE wings and
                                                                                                                                                             Muscular; cytostatic; nootropic; neuroprotective; ophthalmological; antilipaemic; osteopathic; caspase 6; Rieger's syndrome; bone metabolism; ataxia telangiectasia; hyperproliferative disorder; cholesterol disorder; haematopoletic disorder; cancer; neurological; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           An antisense oligonuclectide of 8 to 50 nucleotides in length that inhibits caspase 6, is useful for treating Rieger's syndrome.
                                                                            caspase 6 antisense inhibition related oligo SEQ ID No 120.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 3 A; 5 C; 7 G; 5 T; 0 U; 0 Other;

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.

Example 5; Fig 29; 300pp; English.

The present invention describes a method (M1) for designing capture oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (II) will hybridse with little mismatch, where coligonuclectide probes (II) will hybridse with little mismatch, where coligonuclectide probes (II) will hybridse with little mismatch, where to algonically little mismatch, where coligonuclectide is useful for detecting infectious diseases caused by bacterial infectious agents confidencially little fundatus, viruses e.g. T-cell lymphocytotrophis cirus, peptential ratus, virus and polio virus, and parasitic infectious agents confidencial many virus and polio virus, and parasitic infectious agents confidencial ratus wolvulus, bitaneoba histolytica and Dracunculus medinesis. The method is also useful for detecting genes, or genes concert in specifically associated with a gene selected from BRCA1 genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, muchois also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the control of particular sites and infrared microscope) the support at the presence or absence of the target uncleotide sequences. ABI82074 to represent or include sequences used in the exemplification. the present invention

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in atrisense gene therapy. The composition may have a cuse in atrisense gene therapy. The composition may have a cuse in atrisense gene therapy. The composition may have a cuse in atrisense gene therapy. The composition may have a cuse in a missense gene therapy. The composition may have a cuse in a prophylactic or therapeutic respiratory effect of an antifinanmatory steroid in a subject, for reducing or depleting levels of a ceptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject is tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Once: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO cases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                           PCR primers ABV72389-ABV72416 were used to amplify exons of the human Artemis gene. This gene encodes a V(D)J recombination and/or DNA repair factor that belongs to the metallo beta-Lactamase superfamily, and whose mutations give rise to the human RS-SCID condition. The gene is localised to chromosome 10. The Artemis gene or its nucleic acid is useful for diagnosing or treating severe combined immunodeficiencies (SCIDS) or

The invention relates to an isolated mucleic acid molecule comprising a length of about 100 nucleotides of less, which has a sequence at least about 100 nucleotides of less, which has a sequence at least about 100 nucleotides of less, which has a sequence (CNS) 1 sequence (a locus control region (CCS) element in interleukin gene cluster region of chromosome 5431 containing interleukin (IL) 4, IL5 and IL 131 . Optionally, the nucleic acid has 70% identity to a human CNS-2 to CNS-16 or mouse CNS-16 or their complements. Also included are: (1) an expression cassette comprising a CNS-1 sequence operably linked to a promoter which controls transcription of a heterologous coding sequence. (2) an expression cassette consisting a Sesentially of an IL-4 gene, an IL-13 gene, and A CNS-1 sequence flanked between two comprising one of the expression cassettes or the T-cell; and (7) a comprising one of the expression cassettes or the T-cell; and (7) a comprising one of the expression cassettes or the T-cell; and (7) a non-human transgenic animal where a CNS-1 sequence, (8) a non-human transgenic compact and lacking a CNS-1 sequence is deleted from its chromosome. The T cell is useful for identifying a compound that computes on mutable procession cassettes or the T-cell; and (7) a non-human transgenic animal where a CNS-1 sequence of the CNS-1 sequence of the compound on binding of the transcription factor to a contacting the compound on binding of the transcription factor or the CNS-1 sequence. The compound on binding of the transcription factor or compound. The nucleic acid is useful for modulate sequence of the CNS-1 sequence or or stroking gene expression. The expression cassettes is custofied to cytoking gene expression. The expression cassettes is a cytoking gene expression. The expression cassettes is a cytoking gene expression. Expression assettes is a in vivo compound. The rushing two lines of non-human transgenic animals that the transcription are intentical except one line has the CNS-1 sequence and the other line
                                                                                                                                                                                                                                Novel isolated nucleic acids which are locus control region elements in interleukin gene cluster region of chromosome, referred as conserved non-coding sequences, useful for modulating expression of cytokine genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       degenerate PCR primer used to isolate a CNS sequence from a variety of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               various therapeutic modalities. Human, ARTEMIS protein, V(D)J recombination, DNA repair; gene therapy, severe combined immunodeficiency; SCID; cancer; exon 1; PCR; primer; ss.

```
The invention relates to an Artemis nucleic acid coding for a protein involved in V(D)J recombination and/or DNA repair. Sequences of the invention are useful for treating severe combined immunodeficiencies (SCID) or cancer. They are also useful for diagnoshing a patient, including a prenatal diagnoshs with SCID, a predisposition to cancer, immune deficiency or a carriage of a mutation increasing the risk of progeny to have such a disease. Peptides of the invention are used for preparing antibodies. The invention is useful in gene therapy. The present sequence is a PCR primer used to amplify human Artemis exon 1 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                          The sequence is that of a probe which hybridises to one of the human leukocyte antigen (HLA) sequences in the primer extension products (or strands) produced during PCR amplification of the HLA class I alleles. It is specific for the sequence encoding amino acids 67-71 (CXAKA) of the alpha 1 domain of the HLA-B27 group and is thus specific only for this group. It can be used in the detection and/or identification of an HLA sequence that may be indicative of a patients succeptibility to inflammatory arthropathy such as arthritis and arthritis related diseases. Such diseases include reactive arthritis, rheumatoid arthritis, Reiter's syndrom, uveitis, viral arthritis, psoriatic arthropathy, gouty arthritis, septic arthritis, erythema nodosum, Henoch-Schloelein purpura anthritis, septic arthritis. See also AAQ24895-Q24902. (Updated on 25-WAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oligonuclectide 1, given in AAQ87128, contains an Nael cleavage site (GCC/GGC) and flanking regions, and is about as effective as an equal concentration of Nael sites in pBR322 at activating Nael cleavage of MISMALB DNA. Deletion analysis of oligonuclectide 1, generating oligonuclectides 2-6 (AAQ87129-13), indicates that sequences responsible for activation, in addition to the cognate recognition site, are located within 8-10 bases of either side of the Nael site. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cleavage of resistant DNA sites with restriction enzymes - using activator comprising recognition site and cleavage-permitting flanking

Primers and probes AAT01515-40 and AAT16978-87 are used in a novel method for the specific detection of human herpes viruses (HHV) in which at pleast two types of HHV nucleic acids are pre-amplified by at least 4 primers, followed by a separate detection step using specific detection probes. The primers and probes are synthesised based on the sequences of at least 8 HHV strains selected from HSV1, HSV2, VZV, EBV, CMV, HHV-6A, HHV-6B and HHV-7. They are split into 3 groups: A, B or C. Similarly the probes are split into 3 groups: A, B' and C'. The probes are specific in that they will only detect the amplification prods. from that virus by sandwich hybridisation. This primer is derived from Epstein-Barr virus by and cytomegalovirus (CMV) sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           An oligonucleotide for the amplification and the specific detection of Epstein-Barr virus (EBV) and cytomegalovirus (CMV) - useful for detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Q876296-Q876303 are PCR primers used in a new method for the amplification and specific detection of Epstein-Barr virus (EBV) and cytomegalovirus (CMV). The oligonucleotides are useful for the detcting the EBV and CMV genes from a culture supernatant of herpes virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The oligonucleotides AAQ92471-86 can be used for the detection of cytomegaloviruses in a hybridisation assay. The oligonucleotides may be modified by labelling with radioisotopes, fluorescent compounds, enzymes, nucleotides with linker arms, biotin or the promoter sequence for an RNA polymerase. The oligonucleotides may be optionally immobilised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer, PCR; amplification, probe; human, herpes virus; cytomegalovirus; herpes simplex virus; varicella zoster virus; Epstein-Barr virus;

AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a
                                                                                                                                                                                                                                                                                                                                                                        forms (AAT41710-13) of the murine major histocompability complex
                                                                                                                                                                                                                                                                                                                                                                                 Mutated forms (AAT41710-13) of the murine major histocompability complex interferon-stimulated response element (MMC IRSE) binding sequence (AAT41709), along with other 'competitor' DNAs (AA731714-16), were used in gel shift assays designed to determine whether mouse lymphocyte-specific interferon regulatory factor (LSIRF) (see also AAR99426) is a DNA binding protein. Mutant misRE mutant mt4 (AAT41713) competed well with wild-type MHC ISRE for binding to LSIRF protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphism, biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.
                                                                                                                                                             New genes for murine lymphocyte specific interferon regulatory factor used for modulation of lymphocyte activation and proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated mucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

cc method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyham syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial cypercholesterolemia, polycystic kidney disease, hereditary hereditary hasmorthosis, von Willebrand's disease, tuberous sclerosis, hereditary hasmorthagic telangiectasia, familial colonic polyposis, Bhlers-Danlos syndrome, osteogenesis implemention, cancer, diseases of the nervous syndrome, osteogenesis inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obseity), strength, speed, candurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases

New polynucleotides encoding secreted human proteins potentially useful e.g. immunostimulators.

Disclosure; Page 96; 99pp; English.

The present invention describes human secreted proteins obtained from human fetal brain, fetal kidney or adult blood cDNA libraries. The present sequence represents a probe for a human secreted protein. The human secreted proteins, and polynucleotides encoding them, are predicted human secreted proteins, and polynucleotides encoding them, are predicted

ö to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, haematopoiesis requlating (e.g. as vaccines) or suppressing activity, haematopoiesis requlating activity, tissue growth haemacostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be G-alpha-13; human; inhibitor; cancer; antisense compound; therapy; ss. Gaps ö Antisense compound inhibiting expression of human G-alpha-13 Query Match

ô This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound is useful for treating an animal, particularly humans, having or being prone to a disease or condition associated with the expression of G-alpha Gaps ö Score 13.2; DB 1; Length 18; Pred. c factor designated neublastin. Neublastin is a member of the glial cell
c factor designated neublastin. Neublastin is a member of the glial cell
c factor-detaived neurotrophic factors sub-class of the transforming growth
c factor-beta superfamily of neurotrophic factors. Neublastin exhibits high
affinity for the GFR-alpha-RET receptor complex. The polypeptides can be
used for treating a neurodegenerative disease or disorder, cerebral
ischemic neuronal damage, traumatic brain injury, peripheral neuropathy.
Alzheimer's disease, Huntington's disease, Parkinson's disease, Parkinson
arrophy, Shy-Drager Syndrome, Guamanian parkinsonism dementia complex,
amyotrophic lateral solerosis, memory impairment, or a neuronal disorder
c of the peripheral nervous system, the medulla or the spinal cord. They
can also be used for treating various neuropathies. They can also be used
for treating ischemic stroke, acute brain injury, acute spinal cord
injury, nervous system tumours, multiple solerosis, exposure to
c neurotoxins, metabolic diseases such as diabetes or renal dysfunctions
and damage caused by infectious agents, or various disorders in the eye Claim 33; Page 32; 106pp; English.

Sequences AAZ49796-Z59835 represent antisense oligonuclectides targetted to the human Smad3 gene, which inhibit its expression. The antisense coligonuclectides were designed to target different regions of the human conjuguouclectides were designed to target different regions of the human smad3 mRA, and were analysed for their effect on Smad3 mRAA levels by canditative real-time PCR. The Smad proteins are a family of cytosolic proteins which are involved in TGF-beta superfamily signal transduction. On ligand binding, TGF-beta superfamily proteins (such as bone morphogenetic protein (BMP), activin and TGF-betas themselves) and proteins which then home or heterodimerise and translocate to the nucleus to activite rarget gene transcription. Smad3 translocate to the nucleus to activite respective of subgroup of Smad cannot factors, the pathway-restricted Smads, which are regulated by TGF-beta and activins. It can heterodimerise with Smad4 (196013787-A, AAY69622), the complex being able to activate TGF-beta conformed and cativins. It can heterodimerise with Smad4 canding the transcription. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with smad4 shades.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò

The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation or call differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune deficiencies and disorders e.g. severe combined immunodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versue-host diseases (GVBD), in the induction of tumour immunity, myeloid or lymphoid cell deficiencies, wound healing and tissue repair, in the treatment of burns, incisions and ulcers, as well as in treatment of periodontal disease, osteoporosis or osteoarthritis, mediated by inflammatory processes, diseases (Hunington's disease, amylotrophic lateral selections and SNy-Drager syndrome, infections, inflammatory bowel disease, ulcers, bone regeneration. The protein, having activin- or inhibin-related activities is useful as a contraceptive based on the ability of inhibins male mammals. The proteins and nucleic acids are also spermatogenesis in male mammals. The proteins and nucleic acids are also useful as food supplements. The present sequence is an oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Clark H;
